write python program to check a year is leap or not.

Leap Year Checker in Python

=====

A leap year is exactly divisible by 4 except for century years (years ending with 00). The century year is a leap year only if it is perfectly divisible by 400.

Code

```
def is_leap_year(year):  
    """  
    Checks if a given year is a leap year.  
  
    Args:  
    year (int): The year to check.  
  
    Returns:  
    bool: True if the year is a leap year, False otherwise.  
    """  
    if year % 4 == 0:  
        if year % 100 == 0:  
            if year % 400 == 0:  
                return True  
            else:  
                return False  
        else:  
            return True  
    else:  
        return False
```

```
        return True
    else:
        return False

# Example usage:
year = int(input("Enter a year: "))

if is_leap_year(year):
    print(f"{year} is a leap year.")
else:
    print(f"{year} is not a leap year.")
```

Explanation

This Python program defines a function `is_leap_year` that takes an integer `year` as input and returns `True` if the year is a leap year and `False` otherwise.

The function uses the following logic to check if a year is a leap year:

1. If the year is perfectly divisible by 4, it is a leap year.
2. If the year is a century year (i.e., it ends with 00), it is not a leap year unless it is also perfectly divisible by 400.

The program then uses this function to check if a user-input year is a leap year and prints the result.

Running the Program

To run this program, save it to a file with a `.py` extension (e.g., `leap_year_checker.py`) and execute it using Python (e.g., `python leap_year_checker.py`). When prompted, enter a year to check if it is a leap year.
